fundamental representation in $SU(2)$ and $SU(3)$

$$\begin{aligned} T^a = \tau^a \equiv \frac{\sigma^2}{2} \qquad &\textit{with Pauli matrices } \sigma^a \\ T^a = \vartheta^a \equiv \frac{\lambda^2}{2} \qquad &\textit{with Gell-Mann matrices } \lambda^a \end{aligned} \tag{24}$$

$$\begin{aligned} &\lambda^1 = \begin{pmatrix} 0 & 1 & \\ 1 & 0 & \\ & & 0 \end{pmatrix}, \quad \lambda^2 = \begin{pmatrix} 0 & -i & \\ i & 0 & \\ & & 0 \end{pmatrix}, \quad \lambda^3 = \begin{pmatrix} 1 & & \\ & -1 & \\ & & 0 \end{pmatrix}, \quad \lambda^4 = \begin{pmatrix} & & 1 \\ & 0 & \\ 1 & & \end{pmatrix} \\ &\lambda^5 = \begin{pmatrix} & & -i \\ & 0 & \\ i & & \end{pmatrix}, \quad \lambda^6 = \begin{pmatrix} 0 & & \\ & 0 & 1 \\ & 1 & 0 \end{pmatrix}, \quad \lambda^7 = \begin{pmatrix} 0 & & \\ & 0 & -i \\ & i & 0 \end{pmatrix}, \quad \lambda^8 = \frac{1}{\sqrt{3}} \begin{pmatrix} 1 & & \\ & 1 & \\ & & -2 \end{pmatrix} \end{aligned} \tag{25}$$

As we can see, λ^3 and λ^8 are diagonal. These generators satisfy:

$$[T^a, T^b] = i\epsilon^{abc} T^c \tag{26}$$

The most common convention for the normalization of the generators in physics is:

$$\sum_{c,d} f^{acd} f^{bcd} = N\delta^{ab} \tag{27}$$

The main relation we will use later for SU(N):

$$tr(T^a T^b) = T_{ij}{}^a T_{ji}{}^b = T_F \delta^{ab} \tag{28}$$

$$\sum_a (T^a T^a) = C_F \delta^{ij} \tag{29}$$

$$f^{acd} f^{bcd} = C_A \delta^{ab} \tag{30}$$

With $T_F = \frac{1}{2}$, $C_A = N$ and $C_F = \frac{N^2-1}{2N}$.

$$f^{abc} = -2itr(T^a[T^b, T^c]) \tag{31}$$

$$d^{abc} = 2tr(T^a T^b, T^c) \tag{32}$$

$$T^a T^b = \frac{1}{2}(\frac{1}{N}\delta_{ab} + (d^{abc} + if^{abc})T^c) \tag{33}$$

$$tr(T^a T^b T^c) = \frac{1}{4}(d^{abc} + if^{abc}) \tag{34}$$

$$tr(T^aT^bT^aT^c) = \frac{-1}{4N}\delta_{bc} \tag{35}$$

$$f^{acd}f^{bcd} = N\delta^{ab} \tag{36}$$

$$f^{acd}d^{bcd} = 0 \tag{37}$$

$$f^{ade}f^{bef}f^{cfd} = \frac{N}{2}f^{abc} \tag{38}$$

Fierz identity:

$$\sum_a T_{ij}{}^a T_{kl}{}^a = \frac{1}{2}(\delta_{il}\delta_{kj} - \frac{1}{N}\delta_{ij}\delta_{kl}) \tag{39}$$

and after sum over the lorenz index (σ, σ') and (τ, τ') and unsing the spin addition relation:

$$\sum_{\sigma,\sigma'} \bar{u}_\sigma(q_i)\, u_{\sigma'}(q_i) = \not{q}_i\delta^{oo'},$$
$$\sum_{\tau,\tau'} \bar{v}_\tau(q_j)\, v_{\tau'}(q_j) = \not{q}_j\delta^{ff'} \tag{1.5}$$

and sum over polarization index (λ_1, λ_2) :

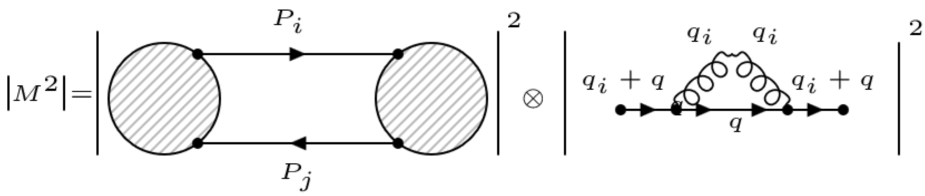
$$\sum_{\mu,\mu'} \varepsilon^{\lambda_2}{}^*_{\mu'}(q)\varepsilon^{\lambda_1}{}_\mu(q) = -g_{\mu\mu'}\delta^{ab} \tag{1.6}$$

$$|M_1|^2 = \frac{-g_s^2[T^a]_o{}^k\,[T^a]_o{}^l}{(q_i+q)^2(q_i+q)^2}[(\not{q}_i + \not{q})\ \gamma^{\mu'}\ \ \not{q}_i\, g_{\mu'\mu}\gamma^\mu\,(\not{q}_i + q)][\not{q}_j] \tag{1.7}$$

from here and after contraction between all indices we can actually make statements about the last result.

$$|M_1|^2 = \frac{-g_s^2[T^a]_o{}^k\,[T^a]_o{}^l}{(q_i+q)^2(q_i+q)^2}[(\not{q}_i + \not{q})\ \gamma^{\mu'}\ \ \not{q}_i\,\gamma_{\mu'}\,(\not{q}_i + q)][\not{q}_j] \tag{1.8}$$

In other words we expect the tree level diagram from LO and a number: Which means:



contribution from LO *a complex number*

$$|M_1|^2 = \frac{-g_s^2 {[T^a]_o}^k \, {[T^a]_o}^l}{(q_i+q)^2(q_i+q)^2}[\not{P}_i][\not{P}_j] \;\otimes\; \color{red}{(a\ complex\ number)} \tag{1.9}$$

Let's calculate the contribution and compare the final result with this expectation:

$$\begin{aligned} N =: \gamma^{\mu'} \; \not{q}_i \, \gamma_{\mu'} &= q_{i\sigma} \, \gamma^{\mu'}\gamma^{\sigma} \;\; \gamma_{\mu'} \\ &= q_{i\sigma} \, (\{\gamma^{\mu'}, \gamma^{\sigma}\} \; - \gamma^{\sigma}\gamma^{\mu'})\gamma_{\mu'} \\ &= q_{i\sigma} \, 2g^{\mu'\sigma} \, \gamma_{\mu'} \; - \; d \, \gamma^{\sigma} \\ &= (2-d) \; \not{q}_i \end{aligned} \tag{1.10}$$

$$|M_1|^2 = -(2-d) \, \frac{g_s^2 {[T^a]_o}^k \, {[T^a]_o}^l}{(q_i+q)^2(q_i+q)^2}[(\not{q}_i + \not{q}) \;\; \not{q}_i \;\; (\not{q}_i + q)][\not{q}_j] \tag{1.11}$$

$$|M_1|^2 = -(2-d) \, \frac{g_s^2 {[T^a]_o}^k \, {[T^a]_o}^l}{(q_i+q)^2(q_i+q)^2}[\not{q}_i \; \not{q}_i \; \not{q}_i + \; \not{q}_i \; \not{q}_i \; \not{q} + \; \not{q} \; \not{q}_i \; \not{q}_i + \; \not{q} \; \not{q}_i \; \not{q}][\not{q}_j] \tag{1.12}$$

For the momenta are on-shell which means:

$$\begin{aligned} \not{q}_i \; \not{q}_i &= {q_i}^2 = {m_i}^2 \\ \not{q} \; \not{q} &= q^2 = m^2 \\ \not{q}_j \; \not{q}_j &= {q_j}^2 = {m_j}^2 \end{aligned} \tag{1.13}$$

we can first neglect the mass of patrons and ignore each term with $\not{q}_i \; \not{q}_i$ and $\not{q} \; \not{q}$ as well.

$$|M_1|^2 = -(2-d) \, \frac{g_s^2 {[T^a]_o}^k \, {[T^a]_o}^l}{(2q_iq)(2q_iq)}[\not{q} \; \not{q}_i \; \not{q}][\not{q}_j] \tag{1.14}$$

$$
\begin{aligned}
L = \not{q}\ \not{q}_i\ \not{q} &= \not{q}[q_{i\sigma}q_\mu\left(\{\gamma^\mu,\gamma^\sigma\}-\gamma^\sigma\gamma^\mu\right)] \\
&\not{q}[2q_i{}^\mu q_\mu - q_{i\sigma}q_\mu\gamma^\mu\gamma^\sigma \\
&= \not{q}(2q_iq) - q_\mu q_{i\sigma}q_\mu[\gamma^\mu\gamma^\mu\gamma^\sigma] \\
&= \not{q}(2q_iq) - q_\mu q_{i\sigma}q_\mu[\frac{\gamma^\mu\gamma^\mu}{2}+\frac{\gamma^\mu\gamma^\mu}{2}]\gamma^\sigma \\
&= \not{q}(2q_iq) - q_\mu q_{i\sigma}q_\mu[g^{\mu\mu}]\gamma^\sigma \\
&= \not{q}(2q_iq) - q_\mu q_{i\sigma}q^\mu\gamma^\sigma \\
&= \not{q}(2q_iq) - q^2\ \not{q}_i \\
&= \not{q}(2q_iq)
\end{aligned}
\tag{1.15}
$$

After inserting the last result of L and simplify the term $(2q_iq)$ from the denominator and nominator because , we get:

$$
|M_1|^2 = -(2-d)\ \frac{g_s^2[T^a]_o{}^k\ [T^a]_o{}^l}{2y(1-2z+2z^2)(p_i\cdot p_j)}[\not{q}][\not{q}_j] \tag{1.16}
$$

Now we are going to use the parametrisation from equation (1) to reduce the 3-member matrix element to 2-member and take out the singularity term from the amplitude.

$$
|M_1|^2 = (d-2)\ \frac{g_s^2[T^a]_o{}^k\ [T^a]_o{}^l}{2y(1-2z+2z^2)(p_i\cdot p_j)}[(1-z)\ \not{p}_i + zy\ \not{p}_j - \sqrt{zy(1-z)}\ \not{m}_\perp][(1-y)\ \not{p}_j] \tag{1.17}
$$

Multiplying the both sides

$$
\begin{aligned}
|M_1|^2 = (d-2)\ \frac{g_s^2[T^a]_o{}^k\ [T^a]_o{}^l}{2y(1-2z+2z^2)(p_i\cdot p_j)}&[(1-z)(1-y)\ \not{p}_i\ \not{p}_j \\
&+zy(1-y)\ \not{p}_j\ \not{p}_j + (1-y)\sqrt{zy(1-z)}\ \not{m}_\perp\ \not{p}_j]
\end{aligned}
\tag{1.18}
$$

and under consideration of the fact that p_i and p_j are the on-shell momenta of the emitter and spectator partons, we can ignore the terms with $\not{p}_i\ \not{p}_i$ and $\not{p}_j\ \not{p}_j$. The $p_i\cdot m_\perp$ and $p_j\cdot m_\perp$ are always 0 because the p_i and p_j are lightlike, i.e. zero transverse component. So those terms can be neglected.

$$
|M_1|^2 = (d-2)(1-z)(1-y)\ \frac{g_s^2[T^a]_o{}^k\ [T^a]_o{}^l}{2y(1-2z+2z^2)(p_i\cdot p_j)}[\not{p}_i][\not{p}_j] \tag{1.19}

and after sum over the lorenz index (σ, σ') and (τ, τ') and unsing the spin addition relation:

$$\begin{aligned} \sum_{\sigma,\sigma'} \bar{u}_\sigma(q_i)\, u_{\sigma'}(q_i) &= \not{q}_i \delta^{oo'}, \\ \sum_{\tau,\tau'} \bar{v}_\tau(q_j)\, v_{\tau'}(q_j) &= \not{q}_j \delta^{ff'} \end{aligned} \tag{1.24}$$

and sum over polarization index (λ_3, λ_4) :

$$\sum_{\nu,\nu'} \varepsilon^{\lambda_4}{}^*_{\nu'}(q)\varepsilon^{\lambda_3}{}_\nu(q) = -g_{\nu\nu'}\delta^{cd} \tag{1.25}$$

$$|M_2|^2 = \frac{g_s^2\,[T^c]_f{}^m\,[T^c]_f{}^n}{(q_j+q)^2(q_j+q)^2}[(\not{q}_j + \not{q})\gamma^\nu\ \ \not{q}_j\,(-g_{\nu\nu'})\gamma^{\nu'}(\not{q}_j + \not{q})]\,[\not{q}_i] \tag{1.26}$$
